This cDNA seqence codes for the beta isoform (see AAW78904) of novel human G1 protein. It was isolated from a human skin fibroblast corresponding to the G1 sequence. CC G1-beta (also called CASH beta, CASH being caspase homologue)

CG 1-beta (also called CASH beta, CASH being caspase homologue)

CG 1-beta (also called CASH beta, CASH being caspase homologue)

CG 4 and a longer isoform, G1-alpha (see AAW78903), represent 2 splice variants of the G1 protein. These G1 proteins are capable of binding to, or interacting directly or indirectly, with MORT-1

CC ASP-8), and thereby of binding to the intracellular domain of the FAS-R receptor, to which MORT-1 binds, or of binding to the intracellular domain of the p55 tumour necrosis factor (TNF)

CC ASP-8), and thereby of binding at the intracellular domain of the FAS-R receptor, to which TRADD binds and to which TRADD protein MORT-1 binds. Hence, they are considered as mediators or modulators of receptor, to which TRADD binds and to Which TRADD protein MORT-1 binds and to FAS-R, and also having a role in e.g. the signalling process that is initiated by the binding of FAS ligand to FAS-R, and also having a role in the signalling process initiated by the binding of FAS ligand (II), vectors and fragments are used to regulate cell death, and its inhibitors augment/enhance the processes. (II) and (III) requiate the FAS-R ligand or TNF effect on cells carrying an FAS-R or inflammatory processes. (II) is used to call searying an FAS-R or inflammatory processes. (II) is used to call searying an FAS-R or inflammatory processes. (II) is used to call searying an FAS-R or inflammatory processes. (II) is used to call searying an FAS-R or inflammatory processes. (II) is used to call searying an FAS-R or inflammatory processes. (III) is used to call searying an FAS-R or inflammatory processes. (II) is used to call searying an equation of its carrying a specific cell surface encoding (II), which kills the cell. Antisense or effects can also be regulated using a vector encoding a ribo DNA encoding isoforms of G1 protein which bind MORI-1 - and late the effects of FAS and tumour necrosis factor receptors, ful for killing of cells e.g. HIV and cancer cells Claim 4; Fig 2; 132pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents DNA coding for MACH-related inducer of toxicity (MRIT) isoform MRIT beta 1 (see AAX'0578), a CED-4 homologue that has pro-apoptotic activity. An EST sequence having homologue that has pro-apoptotic activity. An EST sequence having homology to the p20 domain of human ICE-like protease MACHI/FLICE was isolated from an EST database. Several overlapping EST clones were sequenced to deduce the sequence of the full-length MRIT alpha 1 clone (see AAX25508) and beta 1 clone (see AAX25508) and 2 isoforms, alpha 2 (see AAX25509) and beta 2 in The MRIT gene was localised to the human chromosome 2432-33 and in the MRIT alpha 1. Selective enhancers and inhibitors of MRIT apparate of the full death of treat diseases proliferation. In addition, nucleic acid molecules encoding pro-apoptotic soforms of MRIT can also be used as inducers of pro-apoptotic isoforms of MRIT can also be used as inducers of pro-apoptotic soforms of MRIT can also be used as inducers of programmed cell death. A cell accumulation disorder such as cancer, autoimmune disease, viral infection, angiogenesis and atherosclessis in treated by administering an agent that

A disorder of cell loss, such as a neurodegenerative disorder, including Alzheimer's disease, Parkinson's disease, relinitis pigmentosa, stroke, aplastic anaemia, myocardial infarction or AIDS can be treated by administering an agent that selectively inhibits MRIT apoptotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB 20; Length 1308;

                                                                                                                                                                                                                                                                                å
              This cDNA seqence codes for the alpha isoform (see AAW78903) of novel human G1 protein. It was isolated from a skin fibroblast cDNA luman G1 protein. It was isolated from a skin fibroblast cDNA library using a cDNA probe corresponding to the G1 sequence.

G1-alpha (also called GASH alpha. CASH being caspase homologue) and a shorter isoform, G1-beta (see AAW78904), represent 2 splice variants of the G1 protein. These G1 proteins are capable of binding to, or interacting directly or indirectly, with MORT-1 or with MORT-binding proteins such as McA4 (CASP-10) and MACH (CASP-8), and thereby of binding to the intracellular domain of the FNS-R receptor, to which MORT-1 binds, or of binding to the intracellular domain of the p55 tumour necrosis factor (TNF) receptor, to which PRADD binds and to which TRADD protein MORT-1 binds. Hence, they are considered as mediators or medulators of 1 binds. Hence, they are considered as mediators or medulators of FAS-R having a role in e.g. the signalling process that is initiated by the binding of FAS ligand to FAS-R, and also having a role in the signalling process initiated by the binding of FAS ligand to FAS-R, and also having a role in the signalling process initiated by the binding of FAS ligand (II), vectors and fragments are used to regulate cell death, and its inhibitors augment/enhance the processes. (II) and (II) regulate the FAS-R ligand or TNF effect on processes. (I) and (II) regulate the FAS-R ligand or TNF effect on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New DNA encoding isoforms of G1 protein which bind MORT-1 - and regulate the effects of FAS and tumour necrosis factor receptors, useful for killing of cells e.g. HIV and cancer cells
                                                                                                                                                                                                                                                                                G1 protein; CASH-alpha; human; caspase homologue; Fas receptor;

cells carrying an FAS-R or p55-R. Tumour, HIV-infected or other diseased cells can be treated using a viral vector encoding a viral surface protein, which binds a specific cell surface receptor and a sequence encoding (II), which kills the cell. Antisense oligonucleotides, introduced using the above vector, block the expression of (II) and can also requilate the above effects. These effects can also be requiated using a vector encoding a ribozyme that interacts with a cellular mRNA encoding (II), and allows (II)

HAPOP proteins are apoptosis regulators which have antiarteriosclerotic, cytostatic, antiarthritic and hepatotropic activity. A pharmaceutical composition comprising HAPOP in conjunction with a carrier, a purified antagonist of HAPOP, vectors and agonists of HAPOP, are administered for diagnosing, treating or preventing disorders associated with increased or decreased apoptosis, e.g. cell proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disorders such as atherosolerosis, arteriosolerosis and cancers; immune disorders such as rheumatoid arthritis, systemic lupus erythematosus; reproductive disorders such as prostate cancer, endometrial and ovarian tumours; and gastrointestinal disorders such as cirrhosis, colitis, hepatitis and pancreatitis. The polynucleotides encoding HAPOP proteins may be useful to detect and quantitate expression of HAPOP genes which are correlated with diseases and are also useful to detect differences
                                                                                                                                                                                                                                                                                                                                                     antlarteriosclerotic; antlarthritic; hepatotropic; apoptósis regulator; cell proliferative disorder; atherosclerosis; arteriosclerosis; cancer; mmune disorder; rheumatoid arthritis; systemic lupus erythematosus; reproductive disorder; tumour; gastrointestinal disorder; cirrhosis; colitis; hepatitis; pancreatitis; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    treating or preventing disorders associated apoptosis -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence encodes the human CLARP protein. The invention relates to the human RICK (RIP-like interacting CLARP kinase) protein. The RICK protein acts as a positive regulator of apoptosis, protein acts as a positive regulator of apoptosis, induced by caspase-8 and caspase-10 during CD95 signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors of and pathway inhibitors and chiefly and compositions of recenting compositions. Which will modulate the interactions of the various compositions which will modulate the interactions of the various compositions of and pubse-1. RICK, and the CIDE family of activators (CIDE-B and DRRP-1). RICK is useful in screening assays for agents, useful in the agrowth and dysrequiation of apoptosis. Complexes containing RICK and diagnosis, prognosis or treatment of disease associated with excess cell course blocking CD95-mediated apoptosis. Overexpression of ARC in an molecules blocking CD95-mediated apoptosis. Overexpression of ARC in an in vitro cell system can be used to identify inhibitors compositions of activity of caspase-8: Identification of ARC-like inhibitors compositions of activity of caspase-8: Identification of ARC-like inhibitors compositions of cath in muscle tissue and cardiated apoptosis. Therapeutic compositions of cath in muscle tissue and cardiated associated with increased cell death in muscle tissue and cardiated associated with increased cell death in muscle tissue and cardiated associated with increased cell death in muscle tissue and cardiated associated with the preparation disease. Antirick antibodies can be used as reegents for the preparation or affinity chromatography media, and for diagnostically measuring RICK or affinity chromatography media, and for diagnostically measuring RICK

An EST sequence having homology to the p20 domain of human ICE-like protease MACH/FILEW as isolated from an EST database. Several overlapping EST clones were sequenced to deduce the sequence of the full-length MRIT alpha 1 clone and 2 isoforms, alpha 2 (see the full-length MRIT alpha 1 clone and 2 isoforms, alpha 2 (see the full-length MRIT alpha 1 clone and 2 isoforms, alpha 2 (see the full-length MRIT alpha 1 clone and 2 isoforms, alpha 2 (see the full-length MRIT alpha 1 clone and 2 isoforms, alpha 2 (see the human chromosome 2q32-33 region. MRIT alpha 1 includes an N-terminal death effector domain and a C-terminal caspase homology channed death of systeine protease. Selective enhancers and inhibitors of MRIT apoptotic activity can be identified and used to treat diseases mediated by the dysfunction of programmed cell death. A cell accumulation disorder concoding pro-apoptotic isoforms of MRIT can also be used as inducers of programmed cell death. A cell accumulation disorder such as cancer, autoimmune disease, viral infection, anglogenesis and atherosclerosis is treated by administering an agent that selectively enhances MRIT apoptotic activity, thereby inducing apoptosis in a subject. A disorder of cell loss, such as a

The clone was isolated from a human expressed sequence tag database in a search for potential FADD-related genes. The isolated protein, or cells that express the protein, can be used to screen for agents, e.g. antibodies or T-cell receptors, that specifically modify the binding of Casper to a target, and thus its function. Nucleic acid sequences encoding casper, or fragments of them, are used e.g. as probes and primers for diagnostic detection of Casper genes and their transcripts, for isolation of related sequences and for
identification of wild-type or mutant alleles, also in gene therapy to modulate expression of active Casper protein (using antisense or sense sequences). They are also used for recombinant production of Casper and to generate transgenic animals for testing candidate drugs for Casper-assoclated diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       apoptosis - used, e.g. isolate similar

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence encodes human FIN-1 (FLICE inhibitor-1), which is a caspase. FLICE (ICE-LAP7) is a protean of the interleukin-converting enzyme family, a protein involved in the regulariton of cell death. A host cell, comprising a vector containing FIN-1 encoding DNA, can be used to produce FIN-1. The vector containing the DNA can be used for producing a cell which expresses a polypeptide by transforming or transfecting the cell with it so that the cell expresses the polypeptide encoded the human cDNA contained in the vector. The polypeptide or its antagonist can be used in the treatment of patients needing FIN-1 by in-vivo administration. Conditions which may be treated include viral infection, tumours (especially solid tumours), ischaemic injury (e.g. stroke or myocardial infarction), neurodegenerative disorders (e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                    This cDNA sequence codes for human FLAME-1 (see AAW90107), or FADD-11ke apoptotic/anti-apoptotic molecule 1. FLAME-1 is a novel anti-apoptotic protein that interacts specifically with FADD, McD4, mcD4, mcD5 and FLAME-2. It is recruited to the Fas receptor complex and can abrogate Fas/TNF-induced apoptosis upon expression in Fas/TNF-induced apoptosis in Fas/TNF-induced apoptosis in tiself been generated from the Jurkat library using primers (see itself been generated from the Jurkat library using primers (see itself been generated from the Jurkat library using primers (see AAW84139-42) based on an isolated EST clone. Host cells, recombinant vectors, and methods of using FLAME-1 to identify substrates, activators or inhibitors of FLAME-1 are provided. FLAME-1, e.g. for treating HIV infection or Alzheiner's disease. Inhibitors of the polypeptides can be used as apoptotic agents. FLAME nucleic clidenciles can be used in vivo for antineoplastic purposes.

                                                                                                                                                                                                                                                                                               The invention relates to FADD-like apoptotic/anti-apoptotic proteins (FLAME 1 or 2) and nucleic acid molecules encoding such proteins. FLAME sequences are useful for inhibiting apoptosis and for gene therapy of diseases characterised by apoptosis including HIV infection and Alzhelmer's disease. FLAME inhibitors are useful as apported apoptotic agents and activators are useful as anti-apoptotic agents. FLAME-1 is useful as a substrate for caspase in assays to identify caspase inhibitors. The present sequence is human FLAME-1 CDNA.

The present invention describes a new treatment of a condition characterised by vascular wall inflammation in a subject comprising administering a FLIP molecule to inhibit Fas ligand-mediated apoptosis of vascular endothalial cells in the subject. The method can be used to treat atherosclerosis, transplant arteriosclerosis and

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule (II) encoding a natural dominant negative regulator of cases 8, Filp-C, where (I) specifically pridises with and inhibits expression of the protein, or specifically hybridises with at least an 8-nucleobase portion of an active site on thibitor of Filp-C expression, a modulator of apoptosis and can be used inhibitor of Filp-C expression, a modulator of apoptosis and can be used in antisense gene therapy. (I) is useful for inhibiting the expression of Filp-C in cells or tissues, and for traating an animal having a disease or condition associated with Filp-C. (I) is also useful for modulating apoptosis in a cell, where a caspase such as caspase 8, caspase 3 or caspase 7 is activated, and the Filp-C. (I) is also useful for diagnostics, therapeutics, prophylaxis, as research caspants and kits, for distinguishing functions of various members of a blological pathway, and in antisense gene therapy. (I) is also useful cormiton. The prevent or delay infection, inflammation or committee formation. The prevent sequence encodes human FLP-C as given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ï

This sequence encodes an inhibitor of of Fas-ligand associated with death domain (FADD) like ICE (I-FLICE) protein, designated I-FLICE-1. The domain (FADD) like ICE (I-FLICE) protein, designated I-FLICE-1. The proteins can inhibit both TWFR-1 and CD-95 induced apoptosis. These are the first examples of a naturally occurring catalytically inactive cappase that can act as a dominant negative inhibitor of apoptosis. The case that can act as a dominant negative inhibitor of apoptosis. The polypeptides and agonists can be used for treating e.g. Alzheimer's can stocke. CNS inflammation, osteoporosis, ischaemia, repertusion injury, call death associated with cardiovascular disease, polycystic kidney disease, apoptosis of endothelial cells in cardiovascular disease, cardionas in cardiovascular disease, cardiomas, carcinomas with p53 mutations, damage. Antagonists of the polypeptides can be used for treating cancers consummed adependent tumours, and cancers of the breast, ovary, prostate, bone, liver, lung, pancreas, and spleen), autoimmune disorders con remunatoid arthritis), and viral infections (e.g. theumatoid arthritis) and viral infections (e.g. therpse viruses, occur graft rejection, and chronic graft rejection. The products can also be used for detection, diagnosis and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä

The present sequence encodes human FLICE-like inhibitory protein short form, designated FLIP-S. The present invention describes a new treatment of a condition characterised by vascular wall inflammation in a subject comprising administering a FLIP molecule to inhibit Fas ligand-mediated apoptosis of vascular endothelial cells in the subject. The method can be used to treat atherosclerosis, transplant arteriosclerosis and
